Listing first 45 summaries

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

GENERAL INFORMATION:
APPLICANT: Marc J. Rubenfield et al.
APPLICANT: Marc J. Rubenfield et al.
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO PSEUDOMONAS:
TITLE OF INVENTION: AERUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS
FILE REFERENCE: 107196.136
CURRENT PILING DATE: 1999-02-18
PRIOR APPLICATION NUMBER: US 60/074,788
PRIOR APPLICATION NUMBER: US 60/094,190
PRIOR FILING DATE: 1998-07-27
NUMBER OF SEQ ID NOS: 33142
SEQ ID NO 15669
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence 15409, Application US/09252991A
Patent No. 6551795

proliferative or differentiations component to the treatment of the activity of Skp2 (F-box protein). The method is useful for screening compounds for the treatment of proliferative or differentiative disorders, particularly cancer. These compounds include small molecules, or compounds or derivatives or analogues of the new ubiquitin ligases. The compounds or derivatives or analogues of the new ubiquitin ligases. The compounds prostate cancer or ovarian cancer, lymphoma, small cell lung carcinoma or parathyroid adenomas), major opportunistic infections, disorders, certain cardiovascular diseases or inflammatory disorders. This polymorlectide sequence represents the cDNA encoding an F-box protein (FBP) of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to screening compounds useful for the treatment of
             ubiquitin ligase; breast cancer; prostate cancer; ovarian cancer; small cell lung carcoinoma; immune disorder; parathyroid adenoma; FBP; inflammatory disorder; lymphoma; major opportunistic infection; certain cardiovascular disease; human; gene; ss.

                                                                                                                                                                                                                                                                                                                                                                 Iligases with R-box motifs (F-box proteins) are useful for diagnosis of proliferative and differentiated related disorders by measuring EBP gene expression. Cells expressing such proteins or their fragments are useful for screening compounds. The compounds are agonists or antagonists, which are useful for treating a proliferative or differentiative disorder in a mammal such as and also major opportunistic infections, immune disorders, and also major opportunistic infections, immune disorders, cardiovascular diseases and inflammatory disorders. FBP protein, analogs, derivatives and their subsequences, anti-FBP antibodies are also useful in diagnosis of the disorders.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention provides the protein and coding sequences of 444 novel human proteins. These were isolated from expressed sequences tags (ESTS). They can be used to stimulate cell growth, to regulate haematopoiesis e.g. to treat aplastic anomia, to help tissue regrowth e.g. in burn treatment, to regulate the immune system e.g. to treat multiple sclerosis, to regulate activin or inhibin e.g. to treat infertility, to regulate haemostasis or thrombolysis e.g. to treat

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention describes primer sets for synthesising 5602 full-length cDNAs defined in the specification. Where a primer set comprises: (a) an oligo-dT primer and an oligonucleotide complementary comprises and an oligonucleotide complementary of the complementary strand of a polynucleotide which comprises one of the 5602 nucleotide sequences defined in the specification, where the comprises at least 15 nucleotides; or (b) a combination of an oligonucleotide comprises a sequence complementary to the sequence and an oligonucleotide comprises a 3'-end sequence complementary to the polynucleotide which comprises a 3'-end sequence complementary to a polynucleotide which comprises a 1'-end sequence. The complementary to a complementary strand of a polynucleotide which comprises a 1'-end sequence, the complementary to a polynucleotide which comprises as al-end sequence, the complementary to a complementary to a polynucleotide which comprises as least 15 nucleotides and the combination of the specification. The primer sets can be used in antisense therapy and complementary full-length cDNAs. The primers are also useful for the detection and/or diagnosis of the abnormality of the proteins encoded by the cDNAs assify without any specialised methods.                                                                                                                                                       Sequences ABB10981-ABB12330 represent 1350 novel human polypeptides, and sequences ABA08225-ABA09574 represent nucleic acids encoding them. The fivention also relates to vectors and recombinant host cells comprising a nucleotide of the invention, methods of producing the novel polypeptides, methods of detecting the nucleotides or polypeptides against the polypeptides, methods of detecting the nucleotides or polypeptides in a sample, and methods of identifying compounds which bind to polypeptides of the invention. Although novel, many of the polypeptides of the invention have homology to known proteins, thereby

cc giving an insight into their probable biological activities, and hence potential therapeutic applications. The polypeptides of the invention may differentiation activities; including cytokine, cell proliferation or cell associations activities; stem cell growth factor activity; classe growth activity; classe growth activity; champed activities; haematopolesis regulatory activity; tissue growth activity; chambotic or champion activities; haemastatic, thrombotic or championatic activities; haemastatic, thrombotic or involved in onogenesis, cancer cell proliferation or metastasis. chancer cell proliferation or metastasis. championate activities; polypeptides and nucleotides of the invention are useful for preventing, treating or ameliorating medical conditions, e.g., by protein or gene therapy. Such conditions include conditions, e.g., by protein or gene therapy. Such conditions include cancers, haematopoletic disorders (e.g., myeloid or lymphoid cell cancers, haematopoletic disorders (e.g., myeloid or lymphoid cell cancers), chronic inflammatory conditions (e.g., asthma or arthritis), crapair criticative retinopathy, atherosclerosis, coronary heart disease, arterial ischaemia, bone disorders (e.g., osteoporosis), and abnormal crepair (or nucled caids encoding them) may be used to promote wound cell growth. Polypeptides involved with tissue regeneration and fungal infections in addition to immune disorders. Compared in factions in addition to immune disorders to manipulate stem cells in culture to give rise to neuroepithalial cells promote cell growth. For example, such polypeptides may be used to augment or replace cells damaged by illness, autoimmune disease or accidental damage. The polypeptides and nucleotides candina securing the above conditions, and in drug and and in drug and an eneme and an eneme or accidental damage. The polypeptides and nucleotides candina secuent as deneme represents a condition or accidental damage. The polypeptides and nucleotides conditions to the polypeptides and nucleotides. Th
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 129
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      276

ABZ24703
                         The invention relates to polynucleotides (AAK51456-AAK53435) and the encoded polypeptides (AAM78323-AAM80302) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, hammatopoiesis regulating activity, tissue growth factor activity, immunomodulatory activity and activity and may be useful in the diagnosis and/or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  156
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               189

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present sequence is that of Incyte clone 5565648CB1 encoding human CGDD-15, a novel protein associated with cell growth, differentiation and death. A representative cDNA library for the polynucleotide is LIVRFETOS from foetal liver tissue RNA. Structural features establish the encoded protein as being associated with cell growth, differentiation and death. The invention is based on novel human CGDD-1 to -21 proteins (see ABPS8330-50), the polynucleotides encoding them (see ABZ24689-709), and to the use of these for the diagnosis, treatment or prevention of cell proliferative disorders including cancer, developmental disorders, neurological disorders, autoimmune disorders,

The present invention describes primer sets for synthesising 5602 [ull-length cDNAs defined in the specification. Where a primer set comprises: (a) an oligo-dT primer and an oligonucleotide complementary to the complementary strand of a polynucleotide which comprises one of the 5602 nucleotide sequences defined in the specification, where the coligonucleotide comprises at least 15 nucleotides; or (b) a combination of an oligonucleotide comprising a sequence complementary to the complementary strand of a polynucleotide which comprises a 5'-end sequence and an oligonucleotide comprising a sequence complementary to the complementary strand of a polynucleotide which comprises a 3'-end sequence of polynucleotide which comprises a 3'-end sequence of polynucleotide which comprises a 1'-end sequence of the combination of the specification. The primer sets can be used in antisense therapy and in gene therapy. The primers are useful for synthesising polynucleotides, particularly full-length cDNAs. The primers are also useful for the particularly full-length cDNAs. The primers are also useful for the cheetering and/or diagnosis of the abnormality of the full-length cDNAs are primers allow obtaining of the full-length cDNAs are primers allow obtaining of the full-length cDNAs represent human cDNA sequences; AAB95893 represent human anino acid sequences; and AAH13632 to AAH13632 to Febreach than anino acid sequences; and AAH13632 to AAH13632 to Febreach than anino acid sequences; and a the exemplification of the contents and anion acid sequences; and a sequence of the contents are used in the exemplification of the contents and anion acid sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    7
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       189

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human; cytokine; cell proliferation; cell differentiation; gene therapy; vaccine; peptide therapy; stem cell growth factor; haematopoiesis; tissue growth factor: immunomodulatory; cancer; leukaemia; nervous system disorder; arthritis; inflammation; ss.
                                                                                                                                                                                                                                      The invention relates to F-box protein 44.33 with cytostatic, virucidal, immunomodulatory, antiinflammatory and haemostatic activity. The protein and encoding polynucleotide are used in diagnosis and treatment of malignant tumour, haemopathy, human immunodeficiency virus (HIV) infection, immunological diseases and various inflammations. The polynucleotide is useful in gene therapy.
                                                                                                                                                                       A novel polypeptide, a F-box protein 44.33 and encoding polynucleotide, used in diagnosis and treatment of diabetes, menstrual disturbance, peptic ulcer, arrhythmia, hemosphthisis and epilepsy -

The invention relates to polynucleotides (AAK51456-AAK53435) and the encoded polypeptides (AAM780320, that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, haematopolesis regulating activity, tissue growth factor activity, immunomodulatory activity and activity, insue growth factor activity, immunomodulatory activity and activity, inclusivity and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and inflammation.

Note: Records for SEQ ID NO 2110 (AAK52581), 2111 (AAK52582) and 3666 (AAM80020) are omitted as the relevant pages from the sequence listing were missing at the time of publication.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               CCTTCGTGTTGAGTAACCTGGCGGAGGTGGTGGAGCGTGTGCTCACCTTCCTGCCCGCCA 149

The present sequence is one of 3351 sequences in a library of human polynucleotides. The library is used to detect differentially expressed penes correlated with a cancerous state of a mammalian cell and can detect colon, prostate, breast and lung cancer. The library can be used detect colon, prostate, breast and lung cancer. The library can be used to produce probes for detection of mRNA and to produce additional copies of the polynucleotides for detection of transcription levels. Ribozymes the polynucleotide and for detection of transcription levels. Ribozymes can missense oligonucleotides can be generated. The polynucleotides and their gene products are used as genetic or biochemical markers (e.g. in blood or Lissues) that will detect the earliest changes along the carcinogenesis pathway and/or monitor the efficacy of therapies and antibodies against them can be used in pharmaceutical compositions to treat the cancers and prolliferative disorders such as neoplasia,

Claim I; Page 323; 507pp; English.

polynucleotides, based on which tissues they are most highly expressed in (see AAX84933 for described uses). secreted human protein. The gene number is given in the descriptor line. The gene can be used to generate fusion proteins by linking to the gene to a human immunoglobulin Fc portion (e.g. AAX84924) for increasing the stability of the fused protein as compared to the human protein only. The invention relates to 125 novel genes and their fragments (nucleic acid sequences: AAX84933.X85057; amino acid sequences AAX7567-Y27933) which are useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. Also, pathological polypeptides in a sample or by determining the amount of the new polypuclectides. Specific uses are described for each of the 125 the new polynuclectides. Specific uses are described for each of the 125 the new polynuclectides. This sequence represents a nucleic acid molecule which encodes a

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention describes a library of human polynucleotides comprising the sequences given in AAZ1232 to AAZ1779. Also described is a method of detecting differentially expressed genes correlated with the cancerous state of a mammalian cell, comprising detecting at least one differentially expressed gene product in a test sample from a cell suspected of being cancerous, where the gene product is encoded by one of the 5248 polynucleotide sequences given in AAZ1253 to AAZ17779. The polynucleotides can be used as a source of primers and probes, which can be used for a variety of purpose, e.g. detection of expression lavels, mapping, tissue typing or profiling, forensics, genetic analysis and detection of polymorphisms. Polypeptides encoded by the polynucleotides

The polynucleotides may also be used to construct arrays for diagnostics (which may be used to determine function of an encoded protein): and to detect differences in expression levels between two cells (e.g. to identify abnormal or diseased tissue in a human, to identify a genetic predisposition or susceptibility to a disease such as cancer). The polynucleotides of the invention are especially used in the diagnosis, prognosis and management of colorectal cancer, breast cancer, and lung cancer. The polynucleotides can also be used to screen for

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Job time : 1471 secs
                                                          This invention describes novel isolated human polynucleotides obtained by screening for differential expression in colon cancer, breast cancer call lines. The polynucleotides of the invention are represented in AAX88275-X9918 and encode polypeptides of protein candilates aslected from 4 transmembrane segments integral membrane completed in AAX88275-X9918 and encode polypeptides of protein completed from 4 transmembrane segments integral membrane completed with various cellular activities (AAA), eukaryotic aspartyl proteases, GATA family of transmembrane receptors, ATPASSS associated with various cellular activities (AAA), eukaryotic aspartyl proteases, GATA family of transcription factors, G-protein alpha subunit, phorobelsters or cladaylaylycerol binding proteins, protein kinase, protein phosphatase 2C, protein the phosphatase, trypsin, who domain selected from Ank croceded polypeptides also have a functional domain selected from Ank repeat, basic region plus leucine zipper transcription factors, crepeat, basic region plus leucine zipper transcription factors, bromodomain. Br-hand, SH3 domain, WD domain/G-beta repeats, zinc finger (CCHC class), and zinc-binding metalloprotease domain. The polynucleotides encode polypeptides with similarity to known protein families and are predicted to have similar properties. The novel collypeptides with management of cancers. They can be used for treating e.g. cervical cancers, melanomas, colorectal adenocarcinomas, wilm's tumour, sarcomas, retinoblastoma, myosarcomas, lung carcinomas, wilm's tumour, sarcomas, retinoblastoma, and lymphomas such as histiocytic laukemia, and management of cancers. They can be used for treating e.g. cervical cancers, melanomas, pungential alveolar dysplasia of the cervix, fibrous dysplasia of the cervix, fibrous dysplasia of che cervix, fibrous dysplasia of the cervix, fibrous dysplasia of the cervix, fibrous dysplasia of the cervix fibrous dysplasia of the cervix of prosteine or thyroid hyperplasias, e.g. endometrial, adrenal, breast, procein 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human; gene; gene expression product; diagnosis; therapy; probe;

The present invention describes a library of human polynucleotides comprising the sequences given in AAZ12532 to AAZ1779. Also described is a method of detecting differentially expressed genes correlated with the cancerous state of a mammalian cell, comprising detecting at least one differentially expressed gene product in a test sample from a cell suspected of being cancerous, where the gene product is encoded by one of the 5248 polynucleotide sequences given in AAZ1552 to AAZ1779. The polynucleotides can be used as a source of primers and probes, which can be used for a variety of purpose, e.g. detection of expression levels, mapping, tissue typing or profiling, forensics, genetic analysis and detection of polymorphisms. Polypeptides encoded by the polynucleotides can be used for raising antibodies for experimental, diagnostic and therapeutic purposes. The polynucleotides may also be used to construct therapeutic purposes. The polynucleotides may also be used to construct arrays for diagnostics (which may be used to determine function of an encoded protein); and to detect differences in expression levels between two cells (e.g. to identify abnormal or diseased tissue in a human, to dence cancer). The polynucleotides of the invention are especially used in the cancer, the polynucleotides can be used to screen for cancer, the analysis and management of colorectal cancer, breast cancer, and lung cancer. The polynucleotides can also be used to screen for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

Clone distribution: MGC clone distribution information can be found through the I.M.A.G.E. Consortium/LLL at: http://image.llnl.gov Series: IRAK Plate: 31 Row: h Column: 24
This clone was selected for full length sequencing because it passed the following selection criteria: Hexamer frequency ORF analysis, Genomescan gene prediction, Similarity but not identity to protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         /translation="MADSETFISLEECRGHKRARKRTTMETACALEKLFPROCOVLGI

                                                                                                                                                                                                                                                                     arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
